

FABRIC DISPLAY WITH REVERSE BEND FABRIC ARM**Abstract of the Invention**

A fabric display includes a fabric arm having a main segment that extends forward and terminates in a reverse bend segment at a front end of the fabric arm. A bend arm extends rearward from the reverse bend segment and is adapted to support a leading "salvage" edge of a fabric sheet that is displayed on the fabric arm so that a relatively clean "roll" edge of the fabric is presented to viewers at a front end of the fabric arm adjacent the reverse bend segment. Opposing fabric arms may be attached to a pivotable support arm to allow viewers to easily observe two separate fabric sheets supported on the opposing fabric arms.
